TEROPALPUS LITHOCHARINUS (LE CONTE), A SEASHORE SPECIES (COLEOPTERA: STAPHYLINIDAE)

IAN MOORE

Department of Entomology, University of California, Riverside, CA 92521

Teropalpus lithocharinus was described by LeConte (1877) in the genus Trogophloeus Mannerheim from "Puget Sound, M. G. Davidson". Casey (1889) stated about it, "Two specimens before me were taken by the writer in Marin Co., California". Hatch (1957) reported it under the generic name Carpelinus Leach from "Western Washington, rare". Herman (1970) removed the species to the genus Teropalpus Solier without adding further locality data. None of the above gave any mention of the habitat of the species.

Teropalpus lithocharinus (LeConte)

I have seen a specimen from the Fall collection (MCZ) labeled "Alameda Co., Cal.—as det. by Casey".

In addition, we now have two series of specimens from "CALIF., Marin Co., Bolinas, under driftwood on the beach, D. Giuliani collector", 19 specimens taken on 30 March, 1971, and 7 specimens taken on 11 December, 1971.

This definitely establishes the species as a seashore insect. Because of its distinctive appearance coupled with its habitat, the accompanying illustration should make identification easy when it is again encountered.

I am indebted to Alfred Newton of Harvard University for the loan of the specimen from the Fall collection.
